MODULE 1.2 – FORCES IN SPACE

Presented by:
Prof. Vijay Shinde

Classification of system of forces

A Force in space: The force system which is acting in different planes is called as non-coplanar force system or space forces.

A Force is said to be in space if its line of action makes an angle α , β and γ with respect to rectangular co-ordinate axes X, Y and Z respectively as shown the Fig.

Forces in space

Noncoplanar system of forces (Forces in Space) and Their Classifications

System of forces which do not lie in a single plane is called non-coplanar system of forces(Forces in space).

A typical noncoplanar system of forces (forces in space) is shown in the Fig. below

Noncoplanar system of forces(Forces in space) can be broadly classified into three categories. They are

1. Concurrent noncoplanar system of forces
2. Non-concurrent noncoplanar system of forces
3. Noncoplanar parallel system of forces

1. Concurrent noncoplanar system of forces: Forces which meet at a point with their lines of action do not lie in a plane are called “Concurrent noncoplanar system of forces”. A typical system of Concurrent noncoplanar system of forces is shown in the Fig.

Non-Coplanar and non-Concurrent force system

2. Non-concurrent noncoplanar system of forces: Forces which do not meet at a point and their lines of action do not lie in a plane, such forces are called “Non-concurrent noncoplanar system of forces”. A typical system of non-concurrent noncoplanar system of forces is shown in the Fig.

3. **Noncoplanar parallel system of forces**: If lines of action of all the forces in a system are parallel and they do not lie in a plane such a system is called Non-coplanar parallel system of forces. If all the forces are pointing in one direction then they are called Like parallel forces otherwise they are called unlike parallel forces as shown in the Fig.

Rectangular components of a force in space

- With the angles between \mathbf{F} and the axes,

$$F_x = F \cos \theta_x \quad F_y = F \cos \theta_y \quad F_z = F \cos \theta_z$$

$$\vec{F} = F_x \vec{i} + F_y \vec{j} + F_z \vec{k}$$

$$= F(\cos \theta_x \vec{i} + \cos \theta_y \vec{j} + \cos \theta_z \vec{k})$$

$$= F \vec{\lambda}$$

$$\vec{\lambda} = \cos \theta_x \vec{i} + \cos \theta_y \vec{j} + \cos \theta_z \vec{k}$$

- $\vec{\lambda}$ is a **unit vector** along the line of action of \mathbf{F} ; $\cos \theta_x$, $\cos \theta_y$, and $\cos \theta_z$ are the **direction cosines**

Now applying Pythagorean theorem to the triangles OAB and OCD

$$F^2 = (OA)^2 = OB^2 + BA^2 = F_y^2 + F_h^2 \text{ -----(1)}$$

$$F_h^2 = OC^2 = OD^2 + DC^2 = F_x^2 + F_z^2 \text{ -----(2)}$$

Substituting equation (2) into the equation (1), we get

$$F^2 = F_x^2 + F_y^2 + F_z^2$$

$$F = \sqrt{F_x^2 + F_y^2 + F_z^2} \text{ -----(3)}$$

From the above Figure (Fig.)

$$F_x = F \cos \theta_x, F_y = F \cos \theta_y, F_z = F \cos \theta_z \text{ -----(4)}$$

Where $\theta_x, \theta_y, \theta_z$ are the angles formed by the force F with X, Y, Z axes respectively.

F_x, F_y, F_z are the rectangular components of the force F in the directions of X, Y, Z axes respectively.

$$\cos \theta_x = F_x/F; \quad \cos \theta_y = F_y/F; \quad \cos \theta_z = F_z/F$$

Substituting equation (4) into the equation (3), we get

$$F = \sqrt{F_x^2 + F_y^2 + F_z^2}$$

$$F = \sqrt{F^2 \cos^2 \theta_x + F^2 \cos^2 \theta_y + F^2 \cos^2 \theta_z}$$

$$F^2 = F^2 (\cos^2 \theta_x + \cos^2 \theta_y + \cos^2 \theta_z)$$

$$1 = \cos^2 \theta_x + \cos^2 \theta_y + \cos^2 \theta_z \text{ -----(5)}$$

Force in vector form

Fig. shows a force of magnitude F in space passing through $A (x_1, y_1, z_1)$ and $B (x_2, y_2, z_2)$. The force in vector form is

$$\vec{F} = F \cdot \hat{e}_{AB}$$

$$\vec{F} = F \left(\frac{(x_2 - x_1)\mathbf{i} + (y_2 - y_1)\mathbf{j} + (z_2 - z_1)\mathbf{k}}{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}} \right)$$

\hat{e}_{AB} = unit vector of line AB

$$\vec{F} = F_x \mathbf{i} + F_y \mathbf{j} + F_z \mathbf{k}$$

... Force in vector form

Note: \mathbf{i} , \mathbf{j} and \mathbf{k} printed in bold type denote unit vectors along the x , y and z axis respectively.

Moment of a force

Step 1: Put the force in vector form i.e.

$$\vec{F} = F_x \mathbf{i} + F_y \mathbf{j} + F_z \mathbf{k}$$

Step 2: Find the position vector extending from the moment centre to any point on the force i.e. $\vec{r} = r_x \mathbf{i} + r_y \mathbf{j} + r_z \mathbf{k}$

Step 3: Perform the cross product of the position vector and the force vector to get the moment vector i.e.

$$\begin{aligned} \vec{M}_{\text{point}}^F &= \vec{r} \times \vec{F} \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ r_x & r_y & r_z \\ F_x & F_y & F_z \end{vmatrix} \end{aligned}$$

Rectangular Components in Space

Direction of the force is defined by the location of two points

$M(x_1, y_1, z_1)$ and $N(x_2, y_2, z_2)$

\mathbf{d} is the vector joining M and N

$$\mathbf{d} = d_x \mathbf{i} + d_y \mathbf{j} + d_z \mathbf{k}$$

$$d_x = (x_2 - x_1) \quad d_y = (y_2 - y_1)$$

$$d_z = (z_2 - z_1)$$

$$\mathbf{F} = F \lambda$$

$$= F \left(\frac{d_x \mathbf{i} + d_y \mathbf{j} + d_z \mathbf{k}}{d} \right)$$

$$F_x = F \frac{d_x}{d}$$

$$F_y = F \frac{d_y}{d}$$

$$F_z = F \frac{d_z}{d}$$

Resultant of concurrent forces in Space:-

Resolve all the forces into their rectangular components in X, Y and Z axes directions. Adding algebraically all the horizontal components in the x direction gives

$$R_x = \sum F_x,$$

Similarly adding algebraically all the components in y and z directions yield the following relations

$$R_y = \sum F_y,$$

$$R_z = \sum F_z$$

Thus magnitude of resultant

$$R = \sqrt{R_x^2 + R_y^2 + R_z^2}$$

Angles θ_x , θ_y , θ_z resultant forms with the axes of coordinates are obtained by

$$\cos\theta_x = \frac{R_x}{R}; \cos\theta_y = \frac{R_y}{R}; \cos\theta_z = \frac{R_z}{R}$$

Problems:

- (1) A tower guy wire is anchored by means of a bolt at A is shown in the following Figure. The tension in the wire is 6000N. Determine
- The components F_x , F_y , F_z of the forces acting on the bolt.
 - The angles θ_x , θ_y , θ_z defining the direction of the force.

(2) **Example:** Find the resultant of the three concurrent forces (passing through origin) shown in the figure. The 100N force lies in the X-Y plane.

3) A force of magnitude 50 kN is acting at point A (2,3,4) m towards point B (6, -2, -3) m. Find the moment of the given force about a point D (-1, 1, 2) m

- 4) The tower is held in place by three cables. If the force of each cable acting on the tower is as shown in figure, determine the resultant.

- 5) The resultant of the three concurrent space forces at A is $\bar{R} = -788j$ N. Find the magnitude of F_1 , F_2 and F_3 force.
